

Laura Borst

Electroconvulsive shock damages brains. It causes memory loss. I read that some people who had it suffered such severe memory loss that they were unable to recognize their loved ones. This could cause people to lose memories of their lives, and that could be happy memories along with sad memories. Electroshock should not be done to people and certainly not forced electroshock.

(My name is Laura Borst. I live in Houston, TX, but I have family from Conneticut.)
